ILLUMINATED AEROPLANES IN NIGHT FLIGHTS

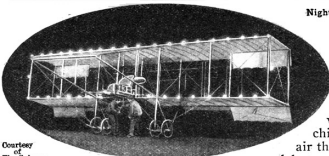

Highly spectacular effects were produced by some recent experiments in flying illuminated aeroplanes at night,

in England. Three aeroplanes were provided with electric lights, the bulbs being spaced about the edges of the planes in such a way that when the machines traveled through the air the effect was that of parallel streaks of light. An interesting feature of the display was the destruction of a dummy battleship by bombs dropped by the airmen, demonstrating how a night attack on a naval force might be carried out.

The whole exhibition suggests interesting possibilities for future fireworks displays.
